Algebra II

18.2.2004: 3 hours

Problem 1. Let q be a prime power. Suppose f is an irreducible polynomial of degree m over \mathbb{F}_q , and let α be a root of f .

- Prove that $\alpha \in \mathbb{F}_{q^m}$.
- Prove that α^{q^n} is a root of f in \mathbb{F}_{q^m} for all integers n .
- Prove that $\alpha, \alpha^q, \alpha^{q^2}, \dots, \alpha^{q^{m-1}}$ are distinct roots of f .

Problem 2. Suppose K is an algebraic extension of a field F . Prove that the following are equivalent:

- K is algebraically closed.
- For every algebraic extension L of F , there is an F -monomorphism from L to K .

Problem 3. Let M be a module over a ring R . An element x of M is called **torsion** if $rx = 0$ for some non-zero r in R . Let $T(M)$ be the set of torsion elements of M .

- Prove that, if R is an integral domain, then $T(M)$ is a submodule of M , and $M/T(M)$ has no torsion elements.
- Find an example where $T(M)$ is not a submodule of M .

Problem 4. Let R be a commutative ring with identity, and let M be a non-zero (unitary) R -module. If $m \in M$, let

$$\text{ord } m = \{r \in R : rm = 0\},$$

and define

$$\mathcal{F} = \{\text{ord } m : m \in M \setminus \{0\}\}.$$

Then \mathcal{F} is partially ordered by \subseteq .

- Prove that $\text{ord } m$ is an ideal of R .
- Prove that every maximal element of \mathcal{F} is a prime ideal.
